Summary

Architecture-driven Backend & Cloud-native DevOps Engineer specializing in Go (Golang) microservices and cloud-native architecture. Expert in optimizing infrastructure and container workloads, backed by CKA, CKAD, CKS and AWS SAA certifications. Proven track record of executing critical language migrations, automating deployment pipelines, and designing scalable event-driven systems.

Certifications

CKS: Certified Kubernetes Security Specialist	
Linux Foundation	
View Certificate	
CKA: Certified Kubernetes Administrator	March 2026
The Linux Foundation	
View Certificate	
CKAD: Certified Kubernetes Application Developer	April 2026
Linux Foundation	
View Certificate	
AWS Solution Architect Associate	July 2025
Amazon Web Services Training and Certification	
View Certificate	
Neo4j Certified Professional	June 2023
Neo4j Academy	
View Certificate	

Experience

Independent Cloud-Native Specialization & Open Source	Remote
Platform Engineer & Cloud Specialist	September 2025 - Present
• Executed an intensive technical deep-dive into advanced cloud-native infrastructure, multi-tenant networking, and container orchestration workflows. • Successfully achieved the industry-standard CKA and CKAD certifications from The Linux Foundation within a 60-day window to validate expert-level cluster administration capabilities. • Engineered and open-sourced high-performance Go utilities (go-es, GDHost, CSGuard) focusing on custom Elasticsearch abstractions, perimeter security filtering, and dynamic Docker container hosting.	
Global Private Technology Co.	Philippines (Remote)
Backend Developer	November 2024 - September 2025
• Led the architectural migration of core enterprise applications from legacy Java to Go, drastically minimizing memory footprint by an estimated 40%–50% and vastly enhancing concurrent request-handling capacity. • Designed and maintained high-throughput, clean-architecture backend features for distributed microservices, ensuring strict code quality standards and low-latency execution. •	

Mentored and managed engineering pods, steering cross-functional alignment, establishing testing patterns, and running structured code reviews to ensure system reliability.

Myanmar Software Integrated Solutions

Cloud Developer

Yangon, Myanmar

April 2024 - August 2024

- Designed and implemented automated GitLab CI/CD pipelines, reducing build-to-deployment times and optimizing delivery velocity for the internal development team.
- Containerized legacy monolithic applications utilizing Docker, establishing consistent local development environments and accelerating staging workflows.
- Provisioned, monitored, and optimized cloud server infrastructures, actively resolving complex network and platform bottlenecks to maintain high application uptime.

<http://myansis.com/>

GoPedagogy Company

Backend/Devops Developer

Singapore(Remote)

April 2022 - December 2023

- Architected and deployed production cluster infrastructures using Nginx and Traefik as reverse proxies/ingress controllers for secure, optimized traffic routing.
- Engineered core Go backend services, utilizing Redis and message brokers to build reliable, decoupled application architectures.
- Streamlined deployment pipelines via GitLab CI and optimized frontend routing architectures utilizing AWS CloudFront to maximize global asset delivery speeds.

Galaxie AI Company

Backend Developer (Intern)

Yangon (Remote)

May 2021 - July 2021

- Developed an internal RESTful API in Go that integrated with Terraform to dynamically provision, configure, and teardown AWS EC2 instances on demand.
- Deployed and managed Eclipse Che development servers, standardizing cloud-based workspaces across the engineering team.

Skills

Golang	SQL Databases	Mongo Database	Jira	AWS Cloud Services
Docker	Git	Apache Kafka	FCM	Gitlab CI/CD
Reverse Proxies	Redis	Neo4j	Helm Chart	Trivy
Apache Web Server	Kubernetes	Ansible	Terraform	

Projects

Task-Queuer

Simple master + worker node task queues using event distribution architecture with complete deployment strategy

<https://github.com/MeowSaiGithub/task-queuer>

Dynamic Form Telegram Bot

Automated interaction bot engineered in Go to handle custom, dynamic form parsing, data validation, and response gathering natively within Telegram channels.

<https://github.com/MeowSaiGithub/tg-form-builder>

go-es

A lightweight, high-performance Go abstraction middleware for Elasticsearch. Simplifies complex full-text search indexing, document retrieval, and cluster interactions for developers looking to bypass native ecosystem configuration overhead.

<https://github.com/MeowSaiGithub/go-es>

CSGuard

Security utility project written in Go focused on request filtering, payload scrubbing, and perimeter network protection mechanics.

<https://github.com/MeowSaiGithub/csguard>

GDHost

The GDHost is a middleware service that allows users to seamlessly upload, orchestrate, and host applications dynamically using Docker containers.

<https://github.com/MeowSaiGithub/GDHost>

School Management System

An advanced, decoupled Event-Driven Microservices Architecture built entirely in Go. Designed and integrated critical distributed system components including real-time WebSockets for notification/chat pipelines, automated file/domain orchestration, and centralized secure OAuth2/OIDC authorization services.
